

We have developed our own Frost Alarm.

This new devices is only for frost warning. Our goal was to make a reliable alarm that is **very easy to install** and **that works on the wet temperature**

It's powered by a 12 or 24 Volt battery (not included). It works with a SIM-card (also not included) so you need mobile network coverage.

You can send SMS warning messages to maximum 3 mobile phones. It's also possible to interrogate the station by sending a text message. The station will send you back all data: wet and dry temperature, relative humidity, dew point, battery voltage and alarm temperature.

When te set temperature is reached, it sends an alarm message to the phone numbers that are saved in the system. It will also send a message when the battery voltage becomes too low.

It comes with a inox pole.
