

From April 2013, we can offer you a whole new range of Weather Stations and Frost Warning Systems.

These new devices are internet based monitoring devices for disease protection, evapotranspiration monitoring, soil moisture monitoring and frost warning.

All stations are powered by a solar panel, so there is no need to recharge the battery. All relevant weather data are permanently measured and sent to the internet climate data base. Your internet browser and login password to this site provides online data, reports and graphs observed in your own orchards or vineyards. On this site, you can input and change the thresholds and telephone numbers to be used in frost warnings.

You can send SMS warning messages to maximum 10 mobile phones. And you can set as many thresholds as you want, on each sensor that is connected. By example, the weather station can send an SMS when the dew point is lower then 0 °C, and another when the dew point drops below -1 °C. If you want to be warned when the wet temperature drops below +1 °C, and below 0 °C, and below -1 °C... it's all possible. Just enter the website with your login and password, change or add a threshold and DONE. It's that easy. In this way, it's very easy to adapt your thresholds according to the blooming stage of your trees.

At this moment, we are working to complete the information about these devices. If you need more information right now, please contact Patrik Stynen on +32 495 517689 or patrik@agrofrst.be
